

## Defining functions with list arguments

All Versions

### Examples

#### Function and Call

Lists as arguments are just another variable:

```
def func(myList):  
    for item in myList:  
        print(item)
```

and can be passed in the function call itself:

```
func([1,2,3,5,7])  
  
1  
2  
3  
5  
7
```

Or as a variable:

```
aList = ['a', 'b', 'c', 'd']  
func(aList)  
  
a  
b  
c  
d
```
